

License Plate Recognition & Security

- SIMEC, as official representative of Zamir and SecuScan for the Spanish market, has developed *SZSecuScan*, a software for integrating the License Plate recognition system from the leader supplier *Zamir* into the top quality and security under-vehicle scanning and monitoring system *SecuScan*.
- *SZSecuScan*, installed on any computer networked with the SecuScan server and the Zamir system, seamlessly integrates both of them, thus delivering the license plate of the vehicle to the SecuScan application software, as well as the plate image captured.
- SecuScan is started-up and configured within a couple of minutes, with a user-friendly interface that includes status monitoring and logging of activities.
- On the configuration window, you can set the IP address and TCP port of the SecuScan computer server and Zamir LPR. The Zamir LPR system must run the 3rd party protocol SOP, available from Zamir Recognition Systems.

Specifications

Requirements	Computer running Windows XP Pro or Windows 2000 10 MB. hard disk space
Synchronizing Communication	Waiting software timer adjustable for Zamir and SecuScan Ethernet TCP/IP
